SUMMARY

Applied AI & Automation Engineer building production systems that respond to leads in seconds, qualify prospects, book appointments, and run business operations without human supervision. Background in mechatronics engineering — trained to design for reliability first, with retry handling, monitoring, and failure recovery built in from day one. Hands-on with AI coding agents (Claude Code, Cursor, Codex), n8n, Make, Zapier, GoHighLevel, and LLM orchestration, with production deployments across healthcare clinics, insurance brokerages, med spas, and golf academies.

EXPERIENCE

AI Automation Engineer | Fynora AI

Mar 2025 – Present

- Deployed an end-to-end AI voice + follow-up automation for a clinic's new-location launch that **booked 42 appointments in the first 36 hours** and handled **500+ leads in under two weeks**, with ~75% of conversions driven by automated follow-up and zero manual lead handling.
- Built AI voice agents (VAPI + CRM) that call inbound leads within seconds of form submission, qualify prospects, book appointments directly into calendars, and hand off to a human only when needed — removing dependency on staff availability at the moment of lead intent.
- Designed missed-call recovery and nurture flows that trigger instant SMS/email follow-ups with booking links and keep sequences running across every pipeline stage in GoHighLevel.
- Use AI coding agents (Claude Code, Cursor, Codex) regularly to work on GitHub repositories — making code changes, troubleshooting issues, and verifying final results work correctly — and to build reusable agent skills, instructions, and workflows used by AI agents across client projects.
- Designed and deployed automation workflows across n8n, Make, and Zapier integrating CRMs, communication systems, and external APIs using webhooks, REST architectures, and OAuth2.
- Implemented structured LLM response pipelines (JSON outputs, function-driven execution) for email processing, ticket routing, information extraction, and contextual response generation.
- Built webhook orchestration, API abstraction layers, logging, and monitoring flows to keep business-critical automations reliable in production — troubleshooting integration failures with retry handling and failure recovery.
- Collaborated directly with operations teams and stakeholders to identify high-impact automation opportunities and ship end-to-end solutions.

AI Design Engineer | Robionix Technologies

Sep 2023 – Feb 2025

- Built a Safe City AI traffic monitoring system using YOLO and OpenCV for vehicle classification, license plate recognition, helmet detection, and automated e-challan generation from live video streams.
- Developed an RFID-based marathon tracking system (C++, MySQL) with automated bib-number detection and participant image categorization pipelines.
- Designed an Urdu speech-activated smart wheelchair using TensorFlow and PyAudio for real-time voice command classification on Raspberry Pi.

Design Engineer | Orbon Technologies

Jun 2023 – Feb 2024

- Built a UGV with GPS-RTK localization and compass-assisted navigation; developed C++ firmware for real-time, low-latency sensor data acquisition in autonomous control systems.

SKILLS

Automation & Integration: n8n, Make, Zapier, GoHighLevel (GHL), VAPI, Webhooks, REST APIs, JSON, Authentication (OAuth2), IMAP/SMTP, Google Sheets, Google Drive

AI Coding Agents & Dev Tools: Claude Code, Cursor, Codex, GitHub Repositories, MCP Servers, Prompt Engineering, Reusable Agent Skills & Instructions

AI & Data Processing: LLM Orchestration, Structured Outputs (JSON), TensorFlow, PyTorch, OpenCV, NumPy, Pandas

Programming & Scripting: Python, JavaScript, Node.js (basic), C, C++, C#, MATLAB — writing and modifying automation scripts

Languages: English (Fluent), Urdu (Fluent)

SELECTED PROJECTS

AI Lead-Response & Workflow Automation System

- Event-driven automation connecting CRMs, email services, webhooks, and conversational AI platforms — with structured AI pipelines for information extraction, task routing, retry handling, and logging.

Real-Time Fire Detection System (YOLOv5 + OpenCV)

- Custom-trained detection model processing live camera feeds for real-time fire identification, designed for edge deployment on Raspberry Pi.

EDUCATION

B.E. Mechatronics Engineering | Air University, Islamabad

2020 – 2024

LEADERSHIP & ACTIVITIES

Team Lead, Robotics & Automation Society (AIR University) • University Ambassador, Youth Robotech 2023 & 2024 (UET Peshawar) • Participant, National Engineering Robotics Contest (NUST EME)
